Summary

Ph.D. candidate in Electrical and Computer Engineering at the University of Florida developing scalable machine learning methods for large-scale 3D microstructure evolution. Combines graph neural networks and physics-regularized modeling to improve the efficiency and long-term stability of mesoscale microstructure evolution prediction. Seeking industry research / ML roles and postdoctoral positions.

Education

- Ph.D. University of Florida**, Electrical and Computer Engineering Gainesville, FL
May 2023 – present
- Advised by Prof. Joel B. Harley (SmartDATA Lab).
 - Research on scalable, physics-guided machine learning for 3D microstructure evolution.
- M.S. University of Florida**, Electrical and Computer Engineering Gainesville, FL
Aug 2021 – May 2023

Experience

- Lawrence Livermore National Laboratory (LLNL)**, Collaborative Research Project Remote / Gainesville, FL
Sept 2025 – present
1 year 1 month
- Scalable hybrid CNN-GNN surrogate for 3D grain growth.
- Designed a hybrid bijective autoencoder + graph neural network surrogate that evolves 3D grain microstructures in a compressed latent space.
 - Developed a latent-space inference strategy achieving up to 117x memory reduction and 115x runtime improvement on 3D meshes up to 160^3 relative to a GNN-only baseline.
 - Work published in Acta Materialia (2026) with collaborators at LLNL.
- SmartDATA Lab, University of Florida**, Graduate Research Assistant Gainesville, FL
May 2023 – present
3 years 5 months
- Physics-regulated interpretable ML for 3D microstructure evolution: built a scalable 3D architecture with spatiotemporal extrapolation and inclination/misorientation-dependent grain boundary dynamics; applied it to Lab-DCT experimental data.
 - Computer vision for experimental microstructure analysis: built a TEM image preprocessing and registration pipeline; fine-tuned U-Net and the Segment Anything Model for microstructure segmentation.
 - Gaussian-sampled mode filter for grain growth: developed Gaussian-sampled kernels that emulate grain boundary motion, mitigate lattice pinning, and improve adherence to the von Neumann-Mullins law over Monte Carlo Potts models.

Skills

Machine Learning

Graph neural networks, convolutional autoencoders, physics-informed / physics-regularized models, surrogate modeling, unsupervised anomaly detection

Computer Vision

Image segmentation (U-Net, Segment Anything Model), image registration and preprocessing, TEM and Lab-DCT microstructure data

Materials Simulation

Grain growth, kinetic Monte Carlo Potts models, mode filter models, 3D microstructure evolution, von Neumann-Mullins analysis

Programming and Tools

Python, PyTorch, PyTorch Geometric, NumPy / SciPy, MATLAB, Git, Linux, HPC clusters

Languages

Chinese (Mandarin)

Native speaker

English

Fluent
